LuitBiz BPM

Business Process Management Software

Efficient business processes are the key to success in dynamic markets.

This efficiency is based on powerful software for integrated Business Process Management (BPM), which will give you greater agility in how you structure business processes and IT systems. It will also enable you to make process workflows leaner and more consistently transparent. In short, the right BPM software makes your core processes more flexible and, well, efficient. Business process management implementation is rapidly rising among organizations to realize cost savings and high return on investments. However, enterprises begin their BPM efforts without a clear understanding of the wide range of issues that must be addressed in order for process improvements to be successfully implemented and sustained over time.

As the heart of business activity, a BPM Suite can be used to bind complex events to meaningful indicators to improve decision making. But a BPM software can also produce events that can, in turn, trigger external rules that help make business operations more intelligent, offering for example real-time KPI monitoring. Business process management (BPM) gives organizations the ability to view, model, automate, process, and standardize the jobs that make up their business processes, helping to increase efficiency and expedite turnaround.

Luitbiz BPM makes it very easy to create process oriented applications that are based on the policies and processes you already use in your organization. Business users can set up processes directly without any programming skills and manage approvals on forms based on user defined workflow templates using LuitBiz BPM. Additionally, users can attach documents at various stages of the approval process to substantiate their views. Since LuitBiz BPM is tightly integrated with LuitBiz DMS, these documents can also be pulled from the already existing documents of LuitBiz DMS.

Making business processes more efficient and approvals faster

User defined processes - easy to use - intuitive design - fast implementation

LuitBiz BPM Process

In LuitBiz BPM, all process management phases are seamlessly integrated providing you with a system that facilitates optimal cooperation among the form users and approvers throughout the entire process cycle. The end-to-end process management of LuitBiz BPM consists of the following 3 phases:

Modelling and simulation: Business processes can be built using simple text forms in LuitBiz BPM. Because of this approach, even business users without any special IT knowledge can build complex without any difficulty.

Implementation and execution: LuitBiz BPM gives users many powerful tools for converting business models into technically feasible processes and generating applications from them. In doing so, users benefit from the mature process engine, which guarantees high scalability and robustness. Processes can go live quickly thanks to the automated generation of executable processes from the business process models. Additionally, the built-in version control engine ensures that during the whole form submission and approval process, historical data is never lost.

Monitoring and reporting: Integrated and mature at both the business and technical level, LuitBiz BPM's monitoring feature makes system administration and process monitoring easier. Constant business analysis of process characteristics combined with excellent monitoring and reporting functions form a transparent basis for continuous process optimization.

Business benefits of LuitBiz BPM:

- Eliminate time consuming and costly manual business processes through process automation.
- Make educated decisions based on enterprise as well as individual process analytics.
- Improve operational efficiency with the ability to direct work based on business rules and organizational best practices.
- Optimize complex business processes while retaining the flexibility to readily make changes in response to the business environment.
- Standardize business processes to achieve consistency in your outcome.
- Measure performance at different levels, including user, group, job, process, and enterprise levels.
- Forecast potential bottlenecks in the flow of work (and alter that flow when necessary).
- Benefit from remote access to business processes

One software, many applications

Growing and constantly changing requirements are presenting companies with new challenges on a daily basis. Even after implementing a state-of-the-art ERP system, there would still be some processes that are not covered. There would still be several processes in quality, marketing, sales, finance and HR that would require manual creation and filling out of forms that need to be approved. A BPM software that combines flexibility and performance enables you to keep pace with these changes. This is why LuitBiz BPM offers such a wide range of application scenarios: transparent modelling of business workflows, implementation of processes based on user roles, all the while guaranteeing process quality and availability. LuitBiz BPM is one software that you can use to take care of multiple processes in various departments without being an IT expert.

Scalability & Security

LuitBiz BPM is highly scalable and can support any number of users. The multi-level, role based permissions system ensures secure data storage and user management. All administrative actions performed by the user can be traced via the Audit Log. System security is ensured by means of SSL, user authentication and password security.

Delivering results for businesses worldwide

Companies of all sizes from all over the world and from a wide variety of sectors have chosen LuitBiz BPM to make their processes more flexible and automate their workflows. They have been won over by our product's technology, ease of use as well as timely and prompt customer support services.
